

ABSTRACT OF THE DISCLOSURE

A spacer clip is attached to a sheet member via a through-hole from one side of the sheet member. The clip has a shank with a flange at one end and arms hinged to the opposite end for insertion in the through-hole in advance of the shank. The arms have levers that engage the flange side of the sheet member, and the arms rotate with the levers as the shank is inserted in the through-hole to a position at which portions of a through-hole section of the sheet member enter spaces between the arms and their levers, and the arms and the flange contact opposite sides of the sheet member.
